DUMBBELL Patent : 099219278

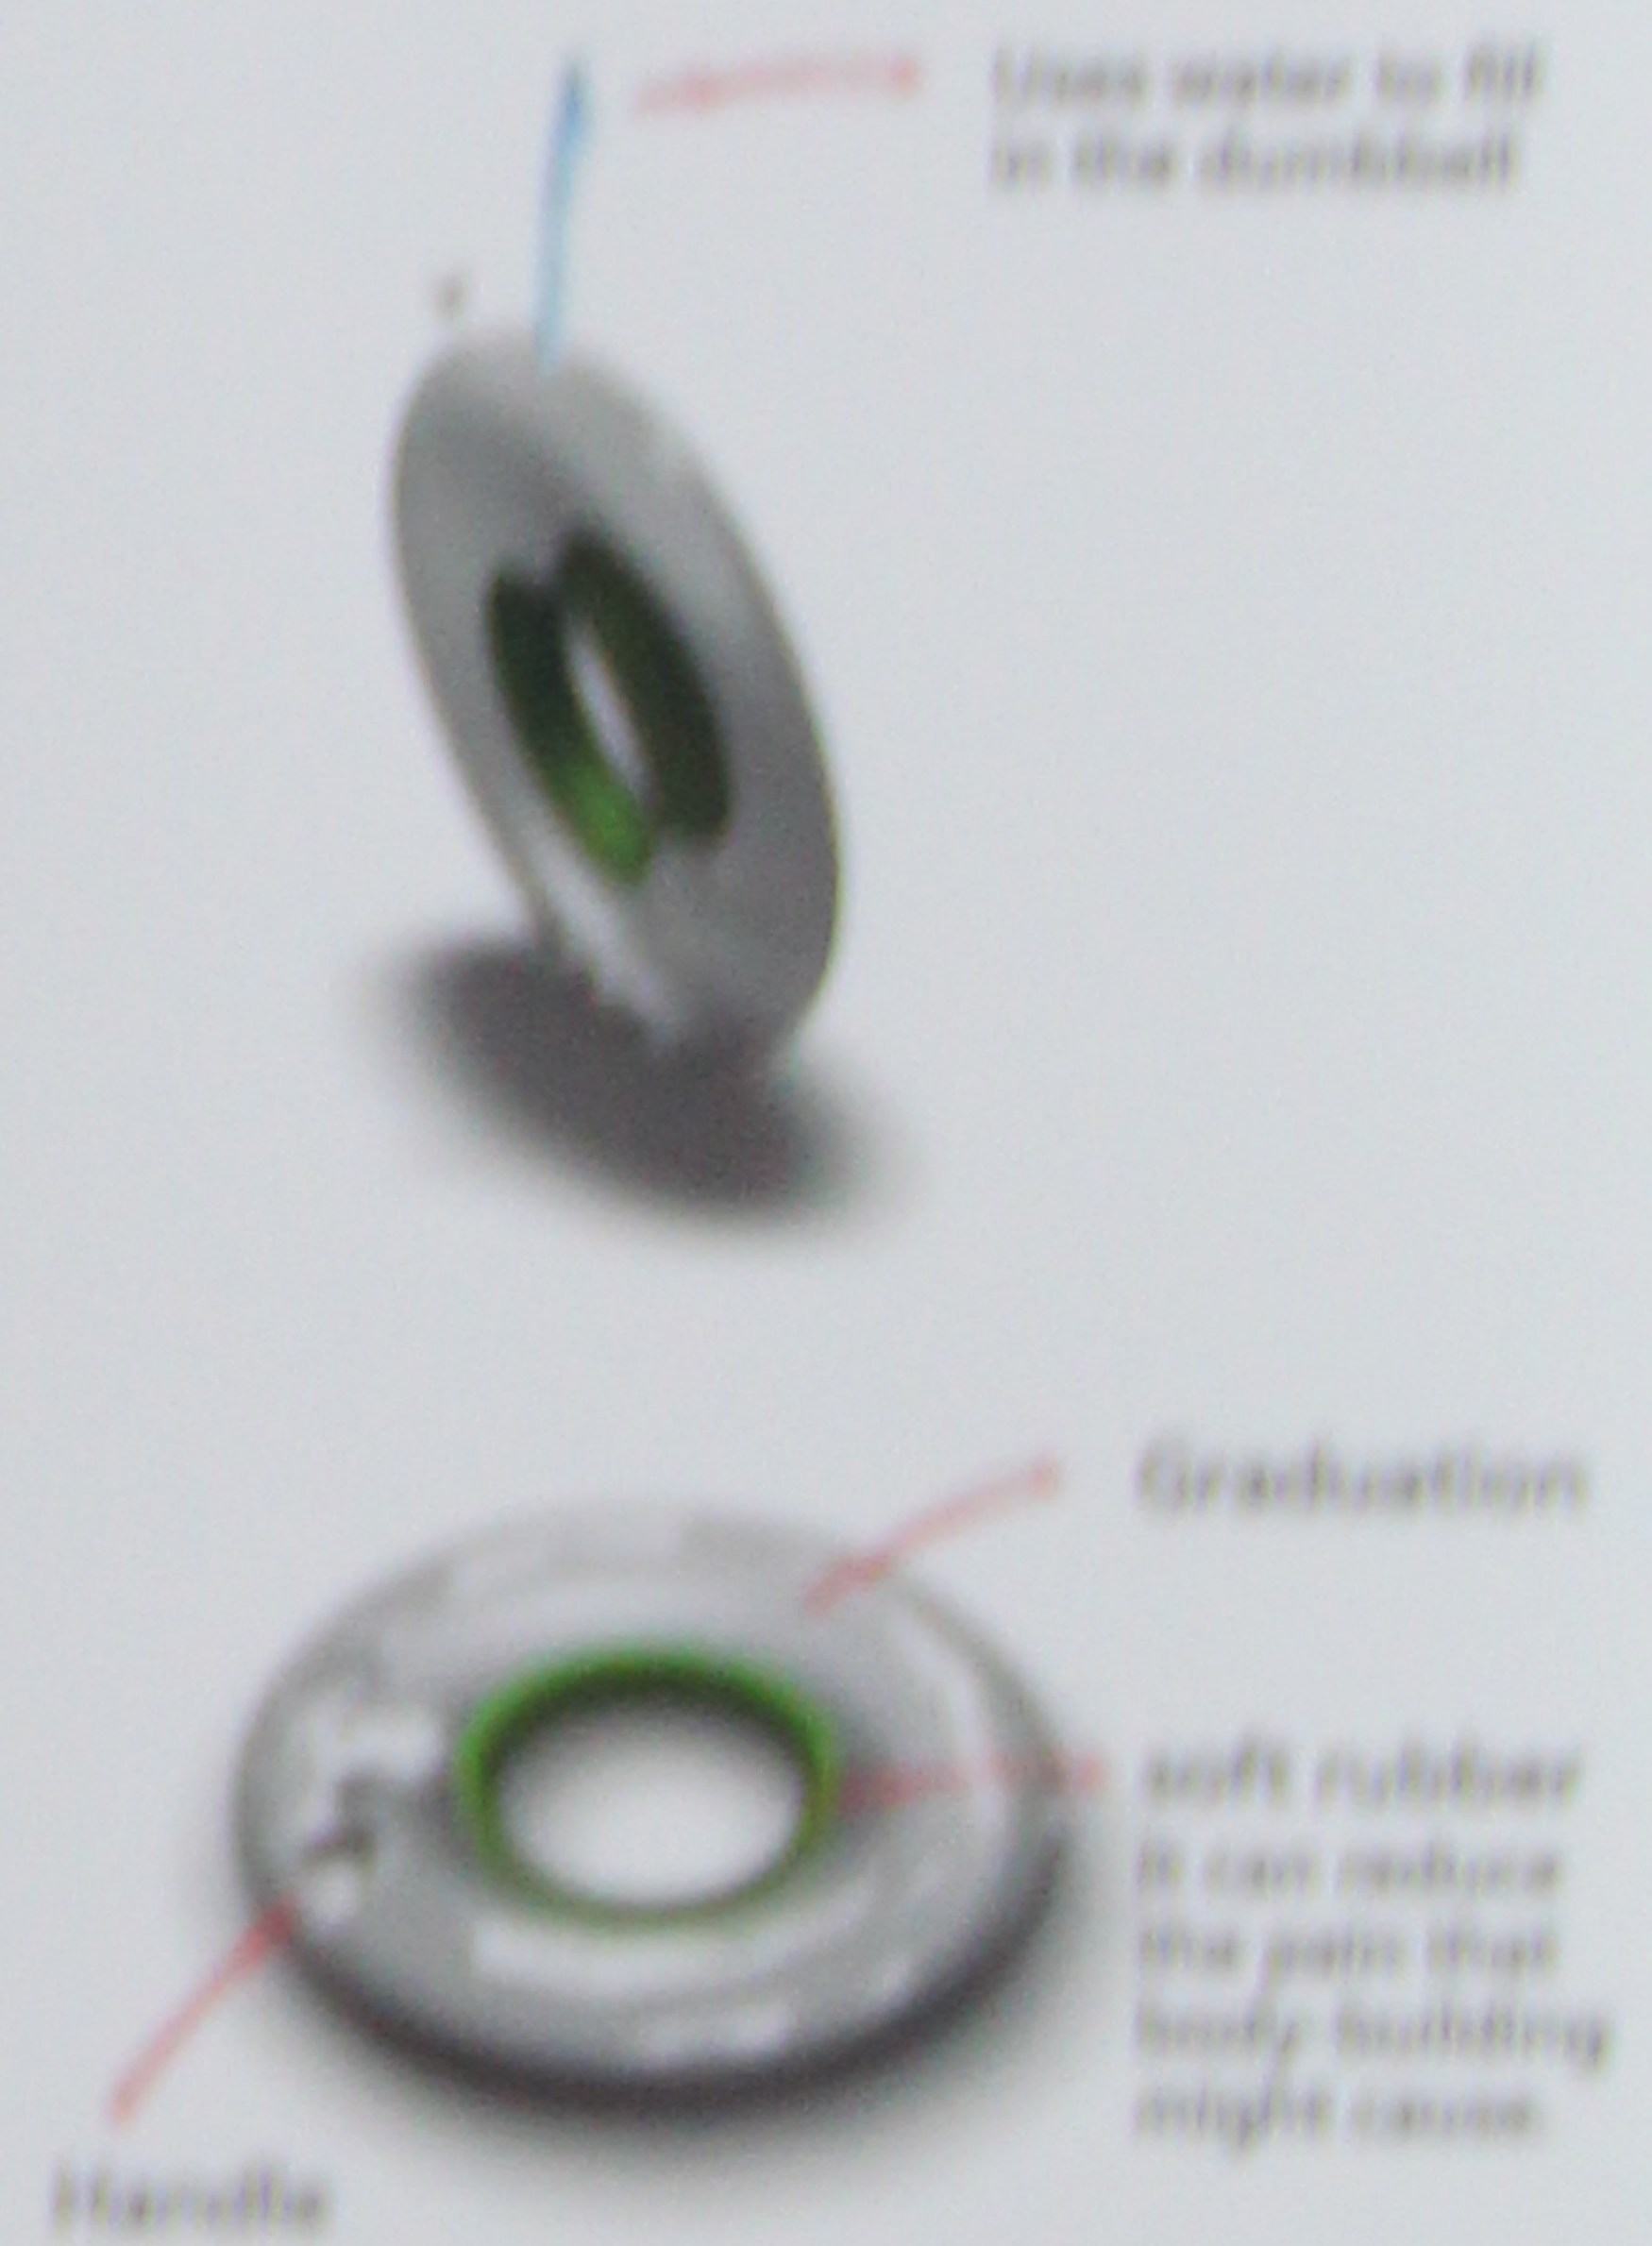

Nowadays, our life is very busy. We work too much and don't have enough time for sport and make our health degenerate, such as our muscles and skeleton. Design a new dumbbell that can easily do body-building for office workers or travelers. Regular body-building exercise can reduce the risk of unhealthy muscles and skeleton.

The traditional dumbbell can only exercise the under part of muscles. This product can accomplish many sports motions. The circles form of the design can be worn on both wrist and ankle area. It can develop the muscles of arm, leg and abdomen.

The part of touching muscles and skeleton is using the soft rubber material. It can reduce the pain that body-building might cause.

Another feature of this design is that it is a green design. It can be used in the dumbbell; therefore, it can replace the traditional dumbbell and reduce the pollution of making dumbbell.

It is too heavy! We carry it to travel or exercise. If we stop to use it, it will become so light that we can carry it.
