

URINAL DESIGN

Content

Urinal general structure, roughly divided into two types, one is the floor type urinal, another wall of type.

When men go to the toilet, urine spraying a parabola on the vertical wall surface, after bounced, and spill out and cause the urine splashed on the body or clothing of the embarrassing phenomenon, which is often present urinal utilized the use by consumers.

The new urinals, the use of inverted cone of the urinal body embedded at the wall, so that the open mouth of slope angle being retained urine collection, the urine can be directed along to inverted cone to the channel wall downwards, but not easy spilled out, this is not only consistent with the use of health conditions, and can overcome the body or clothing of urine splashing from the embarrassment.

Tendency

Because sanitation of the life of any person is necessary, but the parts of the world where any human remains, there are toilets, so you can use this design to solve problems on the toilet, men to better than general market disturbance caused by spill urine right to the market is very wide!
