

# Rolling Cleaner

During house cleaning work, it is usually hard to clean all spaces thoroughly, especially corners under furniture. As time passes by, dust can be accumulated in these areas. Although some robotic vacuum cleaners in the market can clean the hard-to-reach spaces, they are usually noisy, expensive, and power consuming.

The Roller Cleaner uses wind-up gear mechanism to drive the cleaner back-and-forth without extra power. After the user pulls the Cleaner back and releases, the cleaner then starts to roll and collect dust into the dust collection box automatically. When the top cover of the Cleaner touches the wall, the Cleaner bounces back and the user can pick it up then remove and empty the dust collection box.
